English

Mounting instructions

1- Remove the fan body from the TD loosing the fixing screws of the clamps.

2- Fix the support of the TD in the position where the extractor is to be located and replace the fan body on the support taking into account the direction of the flow indicated by the arrow.

3- Stretch and cut the flexible ducting at the required lengths for the inlet and the outlet. The flexible ducting must completely stretched.

4- Connect the flexible ductings to the TD and keep them fixed with the adhesive tape.

5- Make a hole in the ceiling where the disc valve BOR-100 is to be located. Separate the disc valve fron its duct coupling. Put the flexible ducting through the hole in the ciling and connect it to the duct coupling. Then replace the disc valve into the duct coupling.

6- Make a hole in the wall or ceiling where the external grille GR-100 is to be located. Put the flexible ducting through the hole and connect it to the grille. Fit the external grille to the wall or ceiling.

7- Connect the TD to the mains supply. The TD is an extractor designed for a single phase supply as indicated on the rating plate. The electrical installation should be made with a multipolar isolating switch with an opening distance between contacts of at least 3 mm.
